## Add scanning to EPMS to improve inventory tracking and productivity while meeting today's distribution challenges

Expanding EPMS functionality to the production floor and warehouse will provide greater inventory accuracy and location. Benefits include:

- Less time spent looking for items or completed jobs.
- Improved picking accuracy will reduce costs.
- Greater inventory accuracy requires less capital tied up in inventory
- Faster order fulfillment requires less labor.
- Scanning solution can be used to reduce time to complete physical inventory.

### Our Solution:

Our solution provides users with a ruggedized warehouse mobile computer that allows users to make changes to inventory to reflect receiving, shipping, moves, and physical inventory adjustments. This solution connects in real time via a wireless connection to EPMS.

We can also provide an additional level of a warehousing workflow analysis and provide recommendations on changes in process and technology that will provide additional savings through productivity improvements. This may include receiving & sorting, put-away & replenishment, cycle counting & inventory management, label printing, picking & selection, packing, staging, quality control and shipping & delivery.
